

# Confidence intervals, and the bootstrap

# Overview

Quick review of sampling distributions

Confidence intervals

Computing confidence intervals using the bootstrap

# Announcements

Homework 2 has been posted

- Due Sunday (9/15) at 11pm

## Notes:

- There are some useful links for learning R under the "Resources" page on Canvas
- If you get + symbol in the R console it means you entered an incomplete line of code
  - E.g., `sqrt(49`
  - To get back to the regular console (i.e., > symbol) press the escape key

# Quick review: for loops

For loops are useful when you want to repeat a piece of code many times under similar conditions

For loops are particularly useful in conjunction with vectors...

```
my_results <- NULL    # create an empty vector to store the results
for (i in 1:100) {
  my_results[i] <- i^2
}
```

# Quick review: generating random data and sampling

To **generate random data** we use functions that start with the letter *r*

```
> rand_data <- rnorm(100)  
> hist(rand_data)
```

We can sample from a vector using the sample function:

```
> my_vec <- 1:100  
> my_sample <- sample(my_vec, 30)  
> my_sample2 <- sample(my_vec, 30, replace = TRUE)
```

# Review: Sampling distributions

A **sampling distribution** is a distribution of **statistics**

- (a **statistic** is a number computed from a sample of data)

Reminder: For a single **categorical variable**, the main statistic of interest is the **proportion** ( $\hat{p}$ ) in each category

- (shadow of the parameter  $\pi$ )

$$\hat{p} = \text{Proportion in a category} = \frac{\text{number in that category}}{\text{total number}}$$

$\pi_{\text{red}}$

$n = 100$

Sampling distribution!

# Another sampling distribution illustration

$n = 10$

Sampling distribution!

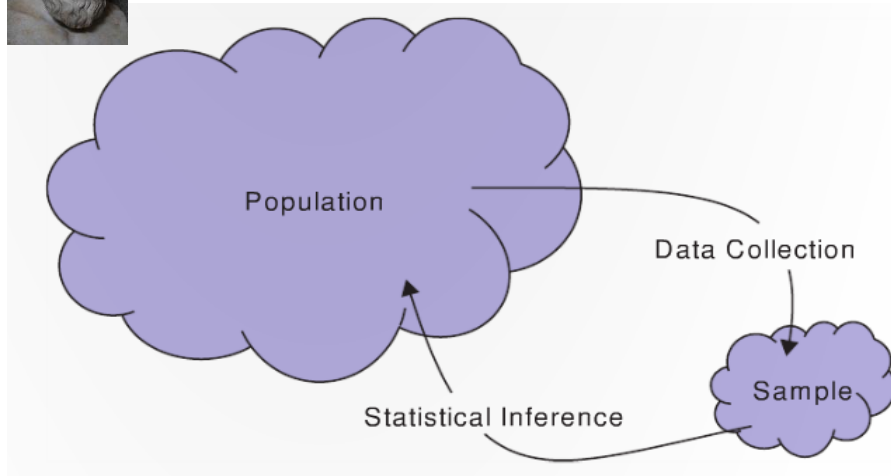

# Review: Sampling distribution

## Why are we interested in the sampling distribution?

- If we knew what the sampling distribution was, then we could evaluate how much we should trust individual statistics

**Parameters:**  $\pi, \mu, \sigma, \rho, \beta$

**Statistics:**  $\hat{p}, \bar{x}, s, r, b$

**Sampling distribution**

The standard deviation of a sampling distribution is called the standard error (SE)

# Review: The central limit theorem

The **central limit theorem** establishes that, in many situations, when independent random variables are summed up, their properly normalized sum tends toward a normal distribution.

Since many statistics we use are the sum of randomly generated data, many of our sampling distributions will be approximately normal

- You will explore this more on homework 2

**Statistics:**  $\hat{p}$ ,  $\bar{x}$ ,  $s$ ,  $r$ ,  $b$

# Normal density function

# Review: Simulating a sampling distributions in R

```
sampling_dist <- NULL
for (i in 1:10000) {
  rand_data <- runif(100)  # generate n = 100 points from U(0, 1)
  sampling_dist[i] <- mean(rand_data)  # save the mean
}
```

```
hist(sampling_dist)      # visualize the sampling distribution
SE <- sd(sampling_dist)  # get the standard error
```

# Review: Simulating sampling distributions from data

Distribution of OkCupid user's heights  $n = 100$

```
heights <- profiles$height
```

```
# get one random sample of heights from 100 people
```

```
height_sample <- sample(heights, 100)
```

```
# get the mean of this sample
```

```
mean(height_sample)
```

# Review: Simulating sampling distributions from data

Distribution of OkCupid user's heights  $n = 100$

```
sampling_dist <- NULL
for (i in 1:10000) {
    height_sample <- sample(heights, 100)  # sample 100 random heights
    sampling_dist[i] <- mean(height_sample) # save the mean
}

hist(sampling_dist)
```

QUESTIONS

The image features a central white rectangular card with the word "QUESTIONS" written in a black, handwritten-style font. This card is surrounded by several smaller, rectangular sticky notes in various colors: yellow, light blue, light green, light orange, and white. Each sticky note has a single black question mark drawn on it. The sticky notes are pinned to a dark blue background with colorful geometric patterns, including zig-zags, hexagons, and circles. The pins are also colorful, matching the sticky notes. The overall composition is vibrant and visually engaging, emphasizing the theme of inquiry and questions.

# Confidence intervals

# Point Estimate

We use the statistics from a sample as a **point estimate** for a population parameter

- $\bar{x}$  is a point estimate for...?  $\mu$

A recent New York Times/Siena College poll found that Trump's favorability rating was 46%

Symbols:

$\pi$ : Trump's favorability for all voters

$\hat{p}$ : Trump's favorability for those voters in our sample

## *Trump and Harris Neck and Neck After Summer Upheaval, Times/Siena Poll Finds*

The survey finds that Donald J. Trump is retaining his support and that, on the eve of the debate, voters are unsure they know enough about where Kamala Harris stands.

THE NEW YORK TIMES/SIENA COLLEGE POLL  
Sept. 3 to 6

# Interval estimate based on a margin of error

An **interval estimate** give a range of plausible values for a population parameter

One common form of an interval estimate is:

*Point estimate  $\pm$  margin of error*

Where the **margin of error** is a number that reflects the precision of the sample statistic as a point estimate for this parameter

# Example: YouGov poll

46% of American have a favorable view of Donal Trump, with a margin of error of 2.8%

- i.e., plus or minus 2.8%

How do we interpret this?

Says that the population parameter ( $\pi$ ) lies somewhere between:

$$46 - 2.8 \text{ to } 46 + 2.8 = 43.2 \text{ to } 48.8$$

i.e., if they sampled all voters the true population proportion ( $\pi$ ) would be likely be in this range

# Confidence Intervals

A **confidence interval** is an interval computed by a method that will contain the ***parameter*** a specified percent of times

- i.e., if the interval was calculated repeatedly from many different random samples, the parameter will be in p% of these intervals

The **confidence level** is the percent of all intervals that contain the parameter

# Think ring toss...

Parameter exists in the ideal world

We toss intervals at it

95% of those intervals capture the parameter

# Wits and Wagers: 90% confidence intervals estimators

I am going to ask you 10 questions

You need to produce an **interval range** that contains the true answer for 9 out of the 10 questions I ask

Please write down your answers on a piece of paper

# 100% confidence intervals

There is a tradeoff between the **confidence level** (percent of times we capture the parameter) and the **confidence interval size**

# Note

For any given confidence interval we compute, we don't know whether it has really captured the parameter

But we do know that if we do this 100 times, 90 of these intervals will have the parameter in it

(for a 90% confidence interval)

# Computing confidence intervals

Let's now discuss how we can compute confidence intervals...

# Recall: sampling distribution illustration

Sampling distribution!

# Sampling distributions

Q: For a sampling distribution that is a normal distribution, what percentage of **statistics** lie within 2 standard deviations (SE) for the population mean?

A: 95%

# Sampling distributions

Q: Suppose we had:

- A statistics value
- The SE
- The sampling distribution was normal

Could we compute a 95% confidence interval?

A: Yes!

$$CI = \text{statistic value} \pm 2 \cdot SE$$

95% confidence interval:  $\text{stat} \pm 2 \cdot SE$

Confidence interval

# Sampling distributions

Q: Suppose we had:

- A statistics value
- The SE
- The sampling distribution was normal

Could we compute a 95% confidence interval?

A: Yes!

$$CI = \text{statistic value} \pm 2 \cdot SE$$

What would happen if we made the margin of error smaller?

- E.g.,  $ME = 1 \cdot SE$

Confidence interval

95% confidence interval:  $\text{stat} \pm 2 \cdot SE$

# Sampling distributions

Q: Could we repeat the sampling process many times to create a sampling distribution and then calculate the SE?

- A: Not in the real world because it would require running our experiment over and over again...

# Sampling distributions

Q: If we can't calculate the sampling distribution, what's else could we do?

- A: We could pick ourselves up from the bootstraps

1. Estimate SE with  $\hat{SE}$
2. Then use  $\bar{x} \pm 2 \cdot \hat{SE}$  to get the 95% CI

# Plug-in principle

Suppose we get a sample of size  $n$  from a population

We pretend that *the sample is the population* (plug-in principle)

1. We then sample  $n$  points *with replacement* from our sample, and compute our statistic of interest
2. We repeat this process 1000's of times and get a ***bootstrap sample distribution***
3. The standard deviation of this bootstrap distribution ( $SE^*$  bootstrap) is a good approximate for standard error SE from the real sampling distribution

# Bootstrap distribution illustration

**Bootstrap distribution!**

3, 3, 3, 5, 3,  
4, 5, 2, 2, 10

$$\bar{x}^* = 4$$

3, 3, 2, 3, 6,  
4, 6, 5, 3, 6

$$\bar{x}^* = 4.1$$

5, 3, 2, 3, 3,  
3, 10, 3, 4, 3

$$\bar{x}^* = 3.9$$

Notice there is no 9's in the bootstrap samples

# 95% Confidence Intervals

When a bootstrap distribution for a sample statistic is approximately normal, we can estimate a 95% confidence interval using:

$$\text{Statistic} \pm 2 \cdot SE^*$$

Where  $SE^*$  is the standard error estimated using the bootstrap

Let's try it in R...

# Formulas for the standard error of the mean

As you likely learned in intro statistics class, there is formula the **standard error of the mean (SE mean)** which is:

$$SE_{\bar{x}} = \frac{\sigma}{\sqrt{n}} \qquad \hat{SE}_{\bar{x}} = \frac{s}{\sqrt{n}}$$

Where:

- $\sigma$  is population standard deviation parameter
- $n$  is the sample size
- $s$  is the sample standard deviation

# Formula for the standard error of a proportion

Likewise, there is a formula for **standard error of a proportion (SE proportions)** which is:

$$SE_{\hat{p}} = \sqrt{\frac{\pi \cdot (1 - \pi)}{n}}$$

$$\hat{SE}_{\hat{p}} = \sqrt{\frac{\hat{p} \cdot (1 - \hat{p})}{n}}$$

Where:

- $\pi$  is the population proportion parameter
- $n$  is the sample size
- $\hat{p}$  is the sample proportion statistic
